

API Testing Assignment Summary

What Was Tested

I tested the API using **GET, POST, and DELETE** requests. I also performed both **positive and negative test scenarios**. Screenshots were captured for each request, including the response body and HTTP status code.

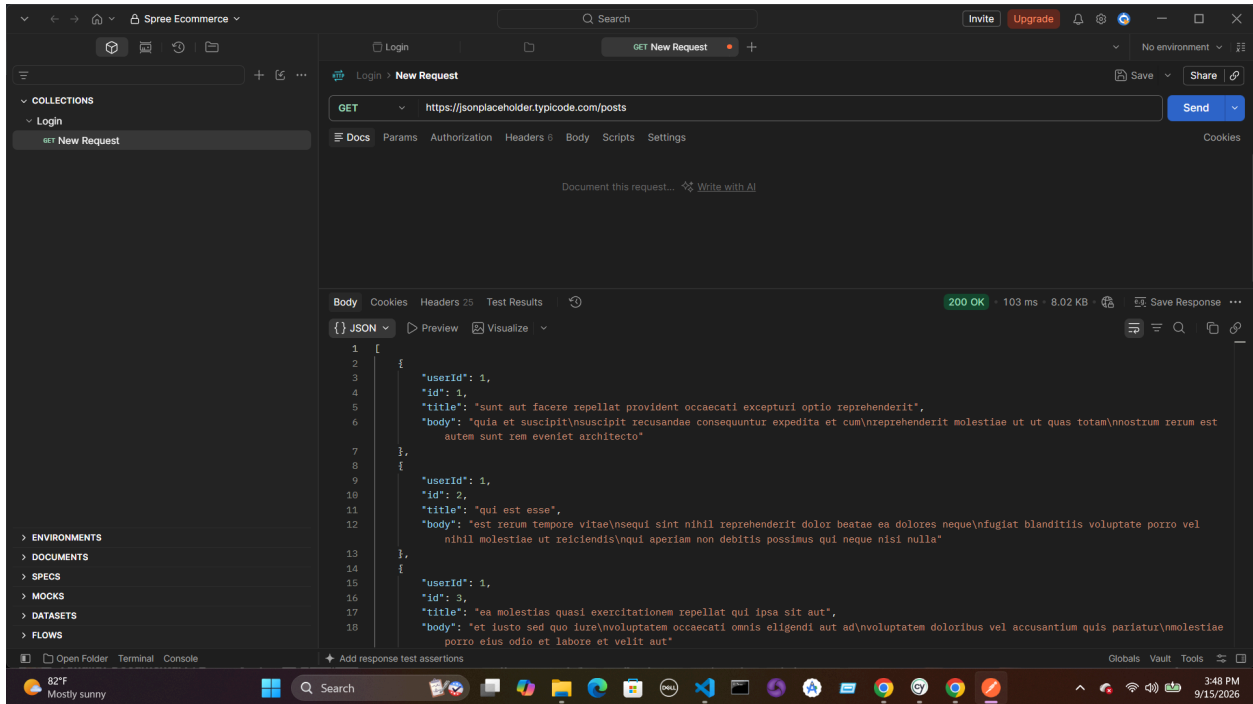

Test Results

- **GET – Get All Posts:** Sent a request to retrieve all 100 posts. All posts were returned successfully with a **200 OK** status.
- **GET – Get First Post:** Retrieved the first post successfully with a **200 OK** status.
- **POST – Add a Post:** Created a new post successfully. The API returned a **200 OK** status.
- **DELETE – Delete a Post:** Deleted the post that was created during the POST test successfully. The API returned a **200 OK** status.
- **Negative Scenario – Invalid Post:** Tried to retrieve a post that does not exist. The API correctly returned **404 Not Found**.

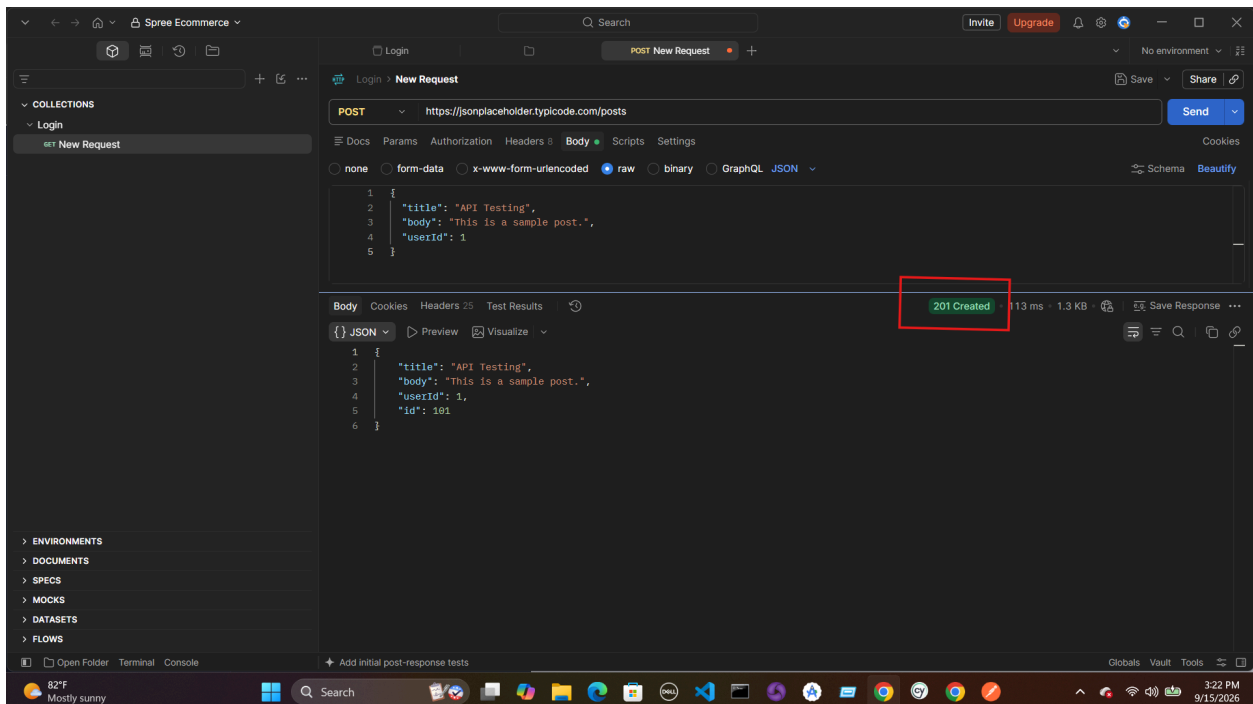

Challenges Faced

One of the main challenges was **API test automation**, because writing the automation code takes additional time compared with performing the tests manually.

GET

POST

DELETE

DELETE
